

MODULE 4 — PRACTICE TASK

CSS Layouts & Advanced Styling

Overview

In this task you will combine everything from Module 4 — Flexbox, HTML Tables, CSS Grid, and Positioning — to build a complete, real-world page: a Pricing Page. Use ChatGPT as your AI pair-programmer whenever you get stuck, but make sure you understand and can explain every line of code you use.

What You'll Practice

- Flexbox for building a navbar and aligning content
- CSS Grid for laying out pricing cards side by side
- HTML Table for a feature-comparison table
- CSS Positioning (relative, absolute, sticky, z-index) for badges and a sticky bar

The Task: Build a Pricing Page

Create a single HTML file (with a linked CSS file) containing the following sections, in order:

1. Navbar (Flexbox)

- Logo/brand name on the left
- Navigation links (Home, Pricing, Contact) on the right
- Use display: flex and justify-content: space-between

Try this ChatGPT prompt:

Give me a simple flexbox navbar with a logo on the left and menu links on the right.

2. Pricing Cards (Grid or Flexbox)

- Exactly 3 pricing cards, arranged side by side (Basic, Standard, Premium)
- Each card includes: plan name, price, a short list of features, and a button
- The middle card (Standard) should stand out — bigger, different color, or slightly raised

- Use CSS Grid (grid-template-columns: repeat(3, 1fr)) OR Flexbox — your choice

Try this ChatGPT prompt:

Give me a starter HTML structure for a pricing page with 3 pricing cards.

3. "Popular" Badge (Positioning)

- Add a small badge that says "Most Popular" on the Standard (middle) card
- The card should have position: relative
- The badge should have position: absolute with top and right (or left) values
- Give the badge a z-index so it always stays above the card content

Try this ChatGPT prompt:

How do I add a 'Most Popular' badge to one card using absolute positioning?

4. Feature Comparison Table (HTML Table)

- Below the cards, add a simple <table> comparing features across the 3 plans
- Use <thead> and <tbody>, with plan names as column headers
- Style it with borders, header background color, and zebra striping (nth-child(even))

Try this ChatGPT prompt:

Give me an HTML table comparing features of 3 pricing plans, with basic CSS styling.

5. Sticky "Contact Us" Bar (Positioning)

- Add a bar at the bottom of the page with a "Contact Us" button
- Use position: sticky with bottom: 0 (or position: fixed) so it stays visible while scrolling

Try this ChatGPT prompt:

How do I make a bottom bar sticky so it stays visible while scrolling?

Bonus Challenges (Optional)

- Make the pricing cards responsive: stack into a single column on small screens
- Add a hover effect on each card (e.g. lift up slightly with a shadow)
- Add a discount badge (like "-20%") on the price using absolute positioning
- Highlight one row of the comparison table when hovered

If You Get Stuck — Ask ChatGPT

Keep your prompts short, specific, and focused on one problem at a time. A few examples:

- "Why is my middle card not bigger than the others?"
- "How do I center text vertically inside a card?"
- "My sticky bar is not sticking to the bottom, what could be wrong?"
- "How do I add spacing between my grid columns?"

Completed Checklist

- ☐ Navbar built using Flexbox
- ☐ 3 pricing cards laid out with Grid or Flexbox
- ☐ "Most Popular" badge positioned correctly on the middle card
- ☐ Feature comparison table with header and zebra striping
- ☐ Sticky/fixed "Contact Us" bar at the bottom
- ☐ Code is saved as index.html and style.css
- ☐ Page tested by scrolling and resizing the browser window

Self-Evaluation

Criteria	Points
Navbar correctly uses Flexbox alignment	10
Pricing cards laid out cleanly with Grid/Flexbox	20
Badge positioned correctly using absolute + relative parent	20
Comparison table structured and styled properly	20

Sticky/fixed bottom bar works while scrolling	20
Overall design neatness & spacing	10
Total	100

Good luck! Build it, break it, fix it — that's how you learn CSS layouts.
